Res. 7:65-73(2000).

Res. 7:65-73(2000).

COFACTOR: BINDS 1 ZINC ION (BY SIMILARITY).

SUBCELLULAR LOCATION: Secreted. Associated with the extracellular matrix (By similarity).

ALTERNATIVE PRODUCTS: 2 ISOFORMS: A LONG FORM (SHOWN HERE) AND A SHORT FORM; MAY BE PRODUCED BY ALTERNATIVE SPLICING.

TISSUE SPECIFCITY: HIGHLY EXPESSED IN ALL FETAL TISSUES.

EXPRESSED SLIGHTLY IN ADULT OVARY, PANCREAS, HEART, KIDNEY, LUNG, PALCENTA. ALSO DETECTED IN SILVAL CORD AND BRAIN. NOT DETECTED IN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  DOMAIN: THE SPACER DOMAIN AND THE TSP TYPE-1 DOMAINS ARE IMPORTANT

TISSUE SPECIFICITY: ENZYMATIC ACTIVITY IS DETECTED AT HIGH LEVEL
IN ALL TYPE I COLLAGEN-RICH TISSUES SUCH AS SKIN, BONES, TENDONS
AND AORTA AND AT LOW LEVEL IN BRAIN AND THYMUS. THE MRNA LEVELS
WERE DISPROPORTIONATELY HIGH IN HEARY, LIVER, RETINA AND MUSCLE.
DOMAIN: THE SPACER DOMAIN AND THE TSP TYPE-1 DOMAINS ARE IMPORTANT
                                                                                                                                                                                                                                                                                                                                                                       16-0CT-2001 (Rel. 40, Created)

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                 This invention relates to a metalloprotease with aggrecanase activity. The invention includes protein and DNA sequences of the metalloprotease, vectors containing the DNA, host cells transformed by the vectors and antibodies directed against the metalloprotease. The antibodies, protein and DNA sequences can be used in the treatment and prevention of joint diseases, particularly osteoarthritis. The treatment may result in osteopathic and antiarthritic activity. The present sequence represents the metalloprotease of the invention termed MDTS6.

in threateners of an abstance, attraction, an appropriate of polypeptide (I) and polynucleotide (II) encoding (I). (I) may be used to polypeptide (I) and polynucleotide (II) encoding (I). (I) may be used to careen for substances (S) that may modulate its activity. Administering a screen for substances (S) that may modulate its activity. Administering (is disorder selected from cancers (e.g., of tissues, of blood or heamatopoletic origin, of the breast, colon, lung, prostrate, cervical, brain, ovarian, bladder or kidney), immune-related diseases and disorders, cardiovascular disease, brain or neuronal-associated diseases (e.g., central or peripheral nervous system diseases, migraine, pain, sexual dysfunction, mood disorders, attention disorders, cognition disorders hypotension, hypertension, psychotic disorders, neurological disorders and dyskinesias), metabolic disorders and inflammatory disorders. (I) may also be useful as a diagnostic tool for a disease or disorder such as those above. AAU72876-AAU72910 represent human processes amino acid sequences of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence is novel human protein (NHP), human protease. WHPs share structural similarity with animal proteases particularly zinc metalloproteases. Sequences of the invention are useful in therapeutic, diagnostic and pharmacogenomic applications. NHP polynucleotides are used as hybridisation probes for screening libraries and assessing gene expression patterns. They can also be used for treating related biological disorders such as obesity, high blood pressure, arthritis, connective tissue disorders and infertility. They are also used in gene therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                       The present invention relates to twenty one new human proteases, referred to as PRTS-1 to PRTS-21. The PRTS polynucleotides and polypeptides of the invention are useful in the diagnosis, treatment and prevention of gastrointestinal e.g. gastritis, esophageal carcinoma and crohn's disease, cardiovascular e.g. atherosclerosis, hypertension and myocardial infarction, autoimmune/inflammatory e.g. acquired myocardial infarction, autoimmune/inflammatory e.g. acquired proliferative e.g. cancer, developmental e.g. Duchenne and Becker muscular dystrophy, epithelial e.g. dermatitis, neurological e.g. epilepsy and Alzheimer's disease and reproductive e.g. infertility and endometriosis disorders. Numerous other examples of each disorder are given in the specification. The present protein sequence represents the human protease PRTS-11 protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            540

The present sequence is rat metalloproteinase ADAMTS-5. The ADAMTS family of proteins is closely related to the ADAM (A Disintegrin and Metalloproteinase Domain) family members of the ADAMTS family contain a thrombospondin domain in addition to the disintegrin and metalloproteinase domains found in the ADAMS. ADAMTS polypeptides are useful for the manufacture of medicaments for treating conditions associated with neuroinflammation and/or neurodegeneration, such as Alzheimer's disease, Parkinson's disease and stroke. They are also useful for treating conditions associated with cell proliferation, cell migration, inflammation and/or anglogenessis, such as cancer, arthritis and autoimmune diseases. They can be used to treat patients afflicted with an invasive tumour, a brain tumour or brain injury.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Polynucleotide encoding novel members of a disintegrin, metalloproteinase and thrombospondin domain protein family used to prevent and treat Alzheimer's disease, cancer and autoimmune diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 89 QGLTGGSSDLRRCFYSGDVNAEPDSFAAVSLCGGLRGAFGYRGAEYVISPLPNASAPAAQ 148

NHPs share structural similarity with animal proteases particularly zinc metalloproteases. Sequences of the invention are useful in therapeutic, diagnostic and pharmacogenomic applications. NHP polynucleotides are used as hybridisation probes for screening libraries and assessing gene expression patterns. They can also be used for treating related biological disorders such as obesity, high

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; novel human protein; NHP; protease; biological disorder; obesity; high blood pressure; arthritis; connective tissue disorder; infertility; gene therapy; enzyme.
                                                                                                                                                                      The present sequence is human metalloproteinase ADAMTS-5. The ADAMTS family of proteins is closely related to the ADAM (A Disintegrin and Metalloproteinase Domain) family. Members of the ADAMTS family contain a thrombospondin domain in addition to the disintegrin and metalloproteinase domains found in the ADAMS. ADAMTS polypeptides are useful for the manufacture of medicaments for treating conditions associated with neuroinflammation and/or neurodegeneration, such as Alzheimer's disease, Parkinson's disease and stroke. They are also useful for treating conditions associated with cell proliferation, cell migration, inflammation and/or anglogenesis, such as cancer, arthritis and autoimmune diseases. They can be used to treat patients afflicted with an invasive tumour, a brain tumour or brain injury.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        419
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Polynucleotide encoding novel members of a disintegrin, metalloproteinase and thrombospondin domain protein family used to prevent and treat Alzheimer's disease, cancer and autoimmune diseases

```
Novel nucleic acid encoding a human protease, useful as a hybridization probe for screening libraries and assessing gene expression patterns -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is novel human protein (NHP), human protease. NHPs share structural similarity with animal proteases particularly zinc metalloproteases. Sequences of the invention are useful in therapeutic, diagnostic and pharmacogenomic applications. NHP polynucleotides are used as hybridisation probes for screening plibraries and assessing gene expression patterns. They can also be used for treating related biological disorders such as obesity, high blood pressure, arthritis, connective tissue disorders and infertility. They are also used in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                241 YLLTLLATAARLYRHPSILNPINIVVVKVLLLRDRDSGPKVTGNAALTLRNFCAWQKKLN 300

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is mouse metalloproteinase ADAMTS-1. The ADAMTS family of proteins is closely related to the ADAM (A Disintegrin and Metalloproteinase Domain) family. Members of the ADAMTS family contain a thrombospondin domain in addition to the disintegrin and metalloproteinase domains found in the ADAMS. ADAMTS polypeptides are useful for the manufacture of medicaments for treating conditions associated with neuroinflammation and/or neurodegeneration, such as Alzheimer's disease, Parkinson's disease and stroke. They are also useful for treating conditions associated with cell proliferation, cell migration, inflammation and/or anglogenesis, such as cancer, arthritis and autoimmune diseases. They can be used to treat patients afflicted with an invasive tumour, a brain tumour or brain injury.
                                                                                                                                                                                                                                                                                                                                                                                                                               Polynucleotide encoding novel members of a disintegrin, metalloproteinase and thrombospondin domain protein family used to prevent and treat Alzheimer's disease, cancer and autoimmune diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                SLVVVKILVIYEEQKGPEVTSNAALTLRNFCNWQKQHNSPSDRDPEHYDTAILFTRQDLC 346

AAZ32000 and AAZ32001 encode, and AAY49501 and AAY49502 represent, human metalloprotease thrombospondin (METH) proteins METH1 and METH2 have been found to be potent inhibitors of angiogenesis both in vitro and in vivo. They can be used for treating cancer and other disorders related to angiogenesis including abnormal wound healing, inflammation, rheumatoid arthritis, psoriasis, endometrial bleeding disorders, diabetic retinopathy, some forms of macula degeneration, haemangiomas, and arterial-venous malformations. They may be useful in treating deficiencies or disorders of the immune system, by activating or inhibiting the proliferation, differentiation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated metalloprotease thrombospondin polypeptides, useful for treating hyperproliferative disorders, cancers or autoimmune disorders
Human; METH1; METH2; anti-anglogenic; metalloprotease thrombospondin; cancer; diagnosis; hyperproliferative disorder; autoimmune disease; anglogenesis inhibitor; abnormal wound healing; infilammation; rheumatoid arthritis; psoriasis; endometrial bleeding disorder; diabetic retinopathy; macula degeneration; haemangloma; detection; arterial-venous malformation; immune deficiency.

                                                                                                                                                                                                                                                                             Metalloprotease)-type metalloproteases MDTS4 (AAB73549) and MDTS5 (AAB73550). The metalloproteases can be used for the treatment of cancers and arthritis. The invention also relates to the genes encoding MDTS4 and MDTS5, vectors and host cells containing the MDTS4 or MDTS5 genes, the recombinant production of MDTS4 and MDTS5, and antibody specific for MDTS4 or MDTS5, and methods of screening for compounds which modulate the activity of MDTS4 and/or MDTS5. The present

                                                                                                                                                                                                                                                                                                                                             This represents a human integrin ligand polypeptide ITGL-TSP. ITGL-TSP polypeptides can be used in the treatment of anglogenic diseases such as cancer, cancer metastasis, chronic inflammatory disorders, rheumatoid attributis, atherosclerosis, macular degeneration or diabetic retinopathy, restenosis, Alzheimer's disease and tissue remodeling. They can be used to treat a subject in need of enhanced activity or expression of the ITGL-TSP polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  448 CELAFGVGSKPCP-YMQYCTKLWCTGKAKGQMVCQTRHFPWADGTSCGEGKLCLKGACVE 506

The present sequence represents human Tango-71. Tango polypeptides are useful for identifying compounds which bind the polypeptide via direct binding, competition binding assays or Tango-71, -73, -74, 76 or -83-mediated signal transduction. Tango polypeptides are also useful for identifying modulating compounds by determining effect on Tango activity. Tango polypeptides and nucleic acids are useful for diagnosing diseases related to aberrant expression of Tango, and Tango polypeptides are useful for raising antibodies which can be used in diagnostic assays for detection of Tango, and also for generating anti-idiotype antibodies for

APPLICANT: Apte, Suneel

APPLICANT: Hirchata, Satoshi

TITLE OF INVENTION: Nucleic Acids Encoding 2inc Metalloproteases

FILE REFERENCE: 26473/4007/10-30-00

CURRENT APPLICATION NUMBER: US/09/369,364A

CURRENT FILING DATE: 1999-08-06

NUMBER OF SEQ ID NOS: 31
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 34.4%; Score 1087.5; DB 4; Length 874; Llarity 43.1%; Pred.
